

YOU CAN'T TRUST THE DECISION-MAKERS UNTIL YOU CAN TRUST THE UNDERLYING DATA.

Introducing SQL Power's

Data Auditing

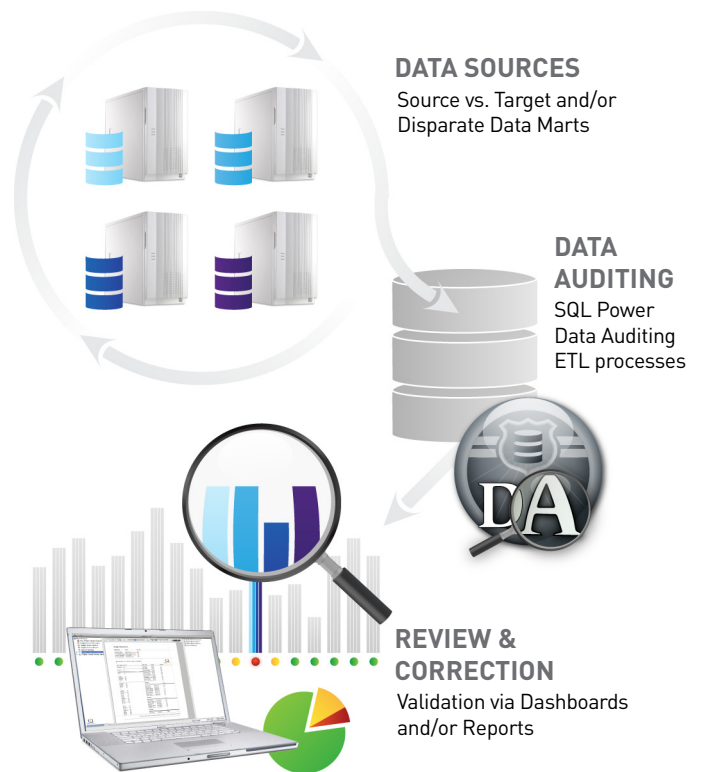

Providing initial and ongoing data audits to ensure the integrity of your Business Intelligence database

The cost of making business decisions based on incomplete or inaccurate data can be huge: even the best executives can make the wrong business decision when it's based on the wrong data. But ensuring that data is synchronized between various systems is a difficult task often ignored by organizations - until key indicators derived from different solutions don't match.

SQL Power helps you avoid this with automated data auditing solutions that allow you to uncover data discrepancies BEFORE the business users do.

SQL Power Data Auditing Services will continuously monitor your BI environment and data sources, ensuring that any discrepancies are quickly identified - thus providing the organization with an "early-warning system" and allowing IT to correct the issue in a timely fashion.

SQL Power's Data Auditing Service is offered as part of our Data Warehouse development, or may be utilized against existing solutions. We have successfully delivered Data Auditing solutions for new system rollouts, data migration efforts, and ongoing regular data loads - confirming the integrity of the systems and providing timely results to the business. Data integrity status is always communicated throughout the organization quickly so that the business can act quickly.

SQL Power's Data Auditing Service offers:

- Reviews of target and source systems to identify discrepancies and provide suggestions for correction
- Development of ongoing data auditing processes that may be delivered in the form of reports or dashboards that highlight data discrepancy issues before your users, allowing for proactive correction
- Validation of parallel solutions during system switch-overs
